Exercício 1

Esboce o lugar das raízes do sistema abaixo para $0 \leq K < \infty$.

$$KG(s) = \frac{K}{s(s+4)(s^2+8s+32)}$$

Exercício 2

Dado o sistema representado pela FTMA abaixo:

(a) Determine a faixa de valores de K para a qual o sistema em malha fechada seja estável.

(b) Esboce o lugar das raízes para $0 \leq K < \infty$.

Exercício 3

2. Roughly sketch the root loci for the pole-zero maps as shown in Fig. 5.51. Show your estimates of the center and angles of the asymptotes, a rough evaluation of arrival and departure angles for complex poles and zeros, and the loci for positive values of the parameter K . Each pole-zero map is from a characteristic equation of the form

$$1 + K \frac{b(s)}{a(s)} = 0,$$

where the roots of the numerator $b(s)$ are shown as small circles o and the roots of the denominator $a(s)$ are shown as \times 's on the s -plane. Note that in Fig. 5.51(c), there are two poles at the origin and there are two poles on the imaginary axis in (f), slightly off the real axis.

Exercício 10

15. A simplified model of the longitudinal motion of a certain helicopter near hover has the transfer function

$$G(s) = \frac{9.8(s^2 - 0.5s + 6.3)}{(s + 0.66)(s^2 - 0.24s + 0.15)}$$

and the characteristic equation $1 + D(s)G(s) = 0$. Let $D(s) = k_p$ at first.

- Compute the departure and arrival angles at the complex poles and zeros.
- Sketch the root locus for this system for parameter $K = 9.8k_p$. Use axes $-4 \leq x \leq 4$, $-3 \leq y \leq 3$;
- Verify your answer using MATLAB. Use the command `axis([-4 4 -3 3])` to get the right scales.
- Suggest a practical (at least as many poles as zeros) alternative compensation $D(s)$ which will at least result in a stable system.
